REPORT ON

FLEET REPLACEMENT PROGRAM POST-IMPLEMENTATION REVIEW

DEPARTMENT OF PUBLIC WORKS

MAY 2001

DRAFT

MAXIMUS, INC. Asset Management Services Division 1350 Piccard Drive, Suite 100 • Rockville, Maryland 20850 (301) 869-2002 • Fax (301) 869-1494

EXECUTIVE SUMMARY

In the spring of 2001, the Town of Chapel Hill retained the Asset Management Services Division of MAXIMUS, INC. (formerly David M. Griffith & Associates, Ltd. – DMG) to conduct an assessment of the fleet replacement program that the Town implemented as a result of a study that we conducted during 1998. This report presents the findings of this post-implementation assessment, and offers recommendations that will allow the Town to continue to replace its fleet assets in a timely manner.

A comprehensive analysis of the fleet in 1998 revealed that a number of units were past due for replacement and that the amount of funding made available annually to renew the fleet had not been sufficient to meet even conservative vehicle replacement standards. As fleet assets age, they become more unreliable, more costly to maintain and repair, and less safe to operate. This leads to increased vehicle downtime and corresponding losses in employee productivity.

Our goal, as we developed the initial replacement plan, was to establish a long-term strategic replacement program that would address the fleet replacement needs of the Town under existing fiscal constraints. We recommended that the Town use lease-purchase agreements in conjunction with a reserve fund and charge-back system to finance all replacement purchases. This approach was recommended because it provided the most benefits while conforming to the Town's long-term financial goals.

The replacement program that was recommended as a result of our original study has been implemented largely along the lines originally proposed. After reviewing the threeyear replacement data, we find that the Town has made significant strides in renewing the fleet and we recommend that it continue to use the replacement planning methodology and financing approach established three years ago. The average age of the Town's fleet assets has been reduced, the condition of the fleet has improved, and salvage values from the disposal of vehicles will increase as they are replaced in a consistently timely manner.

Since a significant portion of the fleet has been replaced and additional vehicles have been added to meet increased service levels and the needs brought on by annexation, we updated the fleet replacement plan using the same replacement program and methodology used in our initial study. In fact, this assessment has highlighted the importance of adjusting the Town's fleet replacement plan annually to reflect actual purchases and the changing operational and service delivery needs of the Town.

The updated replacement plan identifies slightly higher replacement expenditures throughout the planning period than originally projected in 1998. This is due to additional vehicle needs resulting from annexation and the provision of additional services.

This report includes a few additional recommendations that will further strengthen the Town's fleet replacement program. In addition to recommending that the Town continue

FLEET REPLACEMENT PROGRAM REVIEW

using the current replacement planning methodology and financing approach, we also recommended that it move from financing vehicle purchases over three or five-year periods to financing the purchase of some fleet assets over a seven year period, which more closely matches the average useful life of the non-patrol vehicles in the fleet. This will lower future principal and interest payments somewhat and still allow the Town to fully pay off vehicles prior to the end of their useful lives.

INTRODUCTION

BACKGROUND

The Chapel Hill Department of Public Works retained the Asset Management Services Division of MAXIMUS, INC. (formerly David M. Griffith & Associates, Ltd. – DMG) in March 2001 to conduct an assessment of its fleet replacement program. In 1998, DMG assisted the Department in developing a long-term vehicle and equipment replacement planning and financing program. The goal of that project was to improve the Town's ability to replace all of its fleet assets in a timely manner; something that it historically had been unable to do because of its use of ad hoc appropriations to finance most replacement purchases. That study resulted in the implementation of a replacement financing program that increased the total level of funding available for, and eliminated most of the year-to-year volatility associated with, replacing the Town's \$9 million fleet.

OBJECTIVE OF THE CURRENT REVIEW

The Town has completed nearly three annual purchasing cycles using the new replacement program. The scope of this project is to assess the progress that Chapel Hill has made in light of the previous study and to provide comparisons to the original plan recommendations. This review includes comparisons of the actual costs paid and salvage revenues received relative to the assumed values used to develop the original replacement plan. The review also includes an assessment of the financial health of the fleet replacement fund and its adequacy to support current and projected fleet replacement requirements. Although technically beyond the scope of this review, we also have updated the 20 year replacement plan beginning in 2002 and have included the results in this report.

OVERVIEW OF ORIGINAL RECOMMENDATIONS

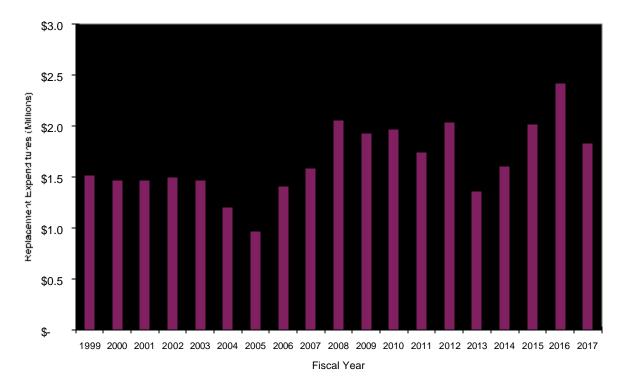

Purpose of Original Study

The purpose of our original study was to design a fleet replacement program that would ensure the timely replacement of vehicles and equipment. The fundamental challenge facing the Town at the time was to figure out how to systematically replace its fleet given the inherent peaks and valleys in year-to-year replacement *spending* needs and the basic evenness of year-to-year revenues and, hence, replacement funding capabilities. Its inability to reconcile these two conflicting factors had resulted in the under funding of fleet replacement, a backlog of replacement needs, and an aging and increasingly unreliable and expensive-to-maintain fleet. The Town realized that in order to meet its ultimate mission, to provide services to its residents as efficiently and effectively as possible, its employees would need safe, reliable vehicles and equipment.

Replacement Plan

When we developed a baseline fleet replacement plan in 1998, two factors became very evident: 1) there was a sizable backlog of vehicles and equipment that were due or overdue for replacement; and 2) large peaks and valleys in annual funding would be required to replace the fleet unless a new replacement financing approach were implemented. Although this baseline plan accurately depicted the then current replacement needs of the Town's fleet (based on the application of various industry-standard replacement guidelines), we recommended that the Town adopt a "smoothed" replacement plan instead, for a number of reasons. The baseline plan would be difficult, if not impossible, to implement logistically for the Department of Public Works. It would also create adverse effects on the Town's fleet maintenance budget in future years as the large group of vehicles purchased in 1998 aged simultaneously and it would create "ripple effects" in the future fleet replacement budget since many of the vehicles and pieces of equipment would come due for replacement at the same time.

To avoid these problems, we developed and recommended the implementation of a modified replacement plan that spread out the costs of renewing the fleet over the first several years of the plan. The smoothed plan (shown below) was developed by postponing the initial replacement dates of certain vehicles which were in reasonably good shape, in spite of the fact that they exceeded the threshold (in terms of age and/or accumulated usage) established for their replacement.

Original Replacement Plan

Financing Options

In the original study, we explored and comparatively evaluated three alternative approaches for financing the projected fleet replacement costs:

- 1. Continuation of the historic approach of financing vehicle purchases using cash from current income that is, from ad hoc appropriations;
- 2. Financing replacement purchases with lease-purchase agreements; and
- 3. Financing purchases with lease-purchase agreements and a reserve fund and charge-back system.

We recommended that the Town implement the third option, using lease-purchase agreements in conjunction with a reserve fund and charge-back system. This financing approach was recommended because it provided the most benefits while conforming to the Town's long-term financial goals. The benefits of this approach included renewing the fleet at a relatively low up-front cost; eliminating most of the volatility associated with year-to-year funding of the Town's fleet replacement costs; and promoting fleet user department recognition of the costs of vehicle availability.

It was recommended that contributions to a new fleet replacement fund be made through internal monthly lease payments by each department for each vehicle and piece of equipment it uses. The payment or contribution amounts for each vehicle were to be comprised of two components: a depreciation charge based on the straight-line amortization of the net (of salvage value) capital cost of the asset; and a replacement surcharge based on a pro rata share of the working capital requirements of the fund. We calculated vehicle-by-vehicle charge-back rates for FY 1999 and provided them in our initial report.

The vehicle replacement fund balance would grow in years in which contributions to the fund exceed outlays for principal and interest (P&I) payments and would shrink in years in which P&I payments exceed contributions. The reserve fund balance would assist the Town in switching from lease-purchase financing to the use of a sinking fund if it decided to fund the vehicle and equipment replacements without the aid of the capital markets. However, this method would not provide for the full funding of the replacement plan if the Town decided not to debt finance replacements in the future.

FINDINGS

PROGRAM ACCOMPLISHMENTS

At the time that the original replacement plan was developed, the Town's fleet was relatively old. The average age of the assets in the fleet in 1998 was 79 months (6.6 years). In contrast, the average recommended replacement cycle for the fleet was 88 months (7.3 years). As indicated in our original report, the average age of a fleet whose vehicles are normally distributed by age should be half of the average replacement

cycle. Based upon these factors, the average age of the fleet, at the time, should have been 44 months (3.65 years).

Since the implementation of the fleet replacement plan in 1999, the Town has been able to significantly improve the age and condition of its fleet. The current average age of the fleet is 57 months (4.75 years). Based upon the new weighted average of replacement cycles now being utilized by the Department of Public Works (92 months – 7.7 years), the average age of the fleet should be 46 months (3.83 years). Prior to implementing the new replacement program, the difference between the actual average age of the fleet and optimal average age of the fleet was nearly three years. This gap has been reduced to less than one year in the short time the new replacement program has been used.

The current average meter reading for the fleet is 25,466 compared to the 33,856 average meter reading of the fleet in 1998. As the fleet continues to be replaced in a consistent and systematic manner in accordance with the long-term fleet replacement strategy, the Town should realize improved efficiencies in all user departments as a result of less downtime for vehicle and equipment repair, lower vehicle operating costs, and increased employee morale and productivity.

The DPW Fleet Maintenance Division has used the original replacement plan as a guide in identifying vehicles for replacement. There have been instances in which vehicles or equipment not scheduled for immediate replacement have been replaced due to catastrophic component failures or other repairs that would require a significant investment to get the vehicle or piece of equipment back into service. These unforeseen, but not unexpected, occurrences have forced staff to modify the original replacement plan slightly. Fortunately, the replacement program is designed to be flexible and accommodate such changes and adjustments relatively easily.

The original replacement plan identified 150 vehicles and pieces of equipment to be replaced from 1999 through 2001. At the conclusion of Fiscal Year 2001, the Fleet Maintenance Division anticipates that 161 new units will have been purchased.

FUTURE DIRECTION OF THE REPLACEMENT PROGRAM

The Town has made significant strides over the past three years in renewing the fleet, and we recommend that it continue to use the replacement planning and financing approaches implemented as a result of our previous study. Timely replacement of the fleet is critical for controlling vehicle availability, reliability, operating efficiency, and, most importantly, the safety of the operator. Inadequate replacement spending not only increases the age and operating costs of the fleet, but also results in the creation of a backlog of replacement needs that can take many years to overcome.

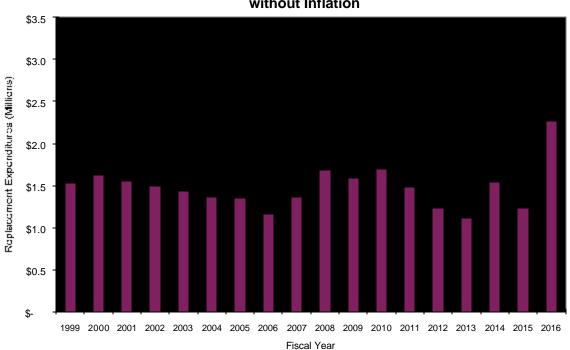

Updated Replacement Plan

Since a significant portion of the Town's fleet has been replaced and other adjustments have been made to the fleet to reflect annexation and other service level demands

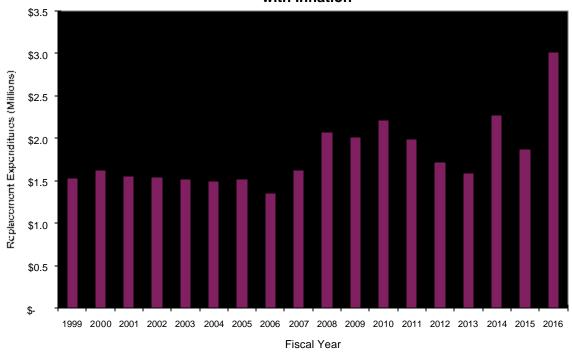

FLEET REPLACEMENT PROGRAM REVIEW

during the first three years since implementation of the replacement plan, we have developed an updated long-term fleet replacement plan. We did this using the same computer program and methodology that we employed in the initial study. We worked with the Department of Public Works to develop an accurate inventory of the vehicles and pieces of equipment to be included in the plan. We then updated the planning parameters (replacement cycles in months and miles), and projected future replacement dates, purchase prices, upfitting costs, and salvage values.

Projected replacement spending requirements under this plan are illustrated in the following charts. The first graph shows future replacement costs in today's dollars; the second shows these costs in future (i.e., inflated or nominal) dollars. The details of this plan are included in Appendix A of this report.

Updated Replacement Plan without Inflation

Updated Replacement Plan with Inflation

The funding requirements and replacement fund balance projections developed by the Finance Department for FY 1999 - 2011 based on this plan are shown in the following table.

Solvency of the Fleet Replacement Fund

A major objective of this post-implementation assessment is to ascertain the ability of the vehicle replacement fund to support the updated replacement plan. As stated previously, the Town has been successful in renewing its fleet under the current approach and we recommend that it continue to use the fleet replacement financing approach that combines lease-purchase financing with the maintenance of a small reserve fund balance.

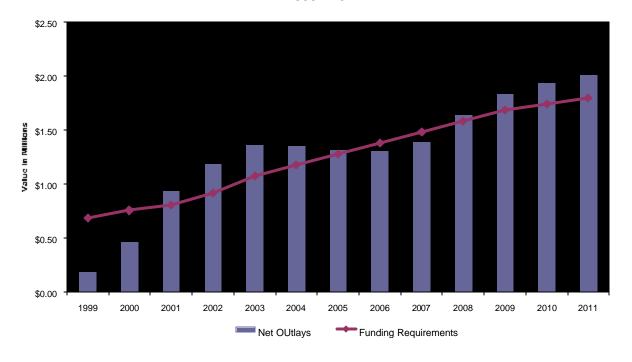

In our original study, we indicated that the accumulation of a small reserve fund balance would make it easier for the Town to 1) increase annual replacement spending to a level that is consistent with sound fleet replacement practices; and 2) transition from debt to cash financing should the Town ever decide to stop lease purchasing its vehicles. It was never anticipated that the fund balance would grow large enough that the Town would be able to eliminate debt financing in a single year without reducing the number of replacement purchases significantly in that year.

The premature depletion of the fund balance would make it harder for the Town to stop relying of debt financing, but we know of no compelling reason for it to do this now or in the foreseeable future. The cost of capital under the current financing approach is less than that associated with using cash from either ad hoc appropriations or a sinking fund because the Town can borrow cash at tax-exempt rates and invest cash at taxable rates. Typically, the former run about 150 to 200 basis points lower than the latter.

It is important to note, however, that the ongoing maintenance of a small fund balance reduces the volatility of the Town's year-to-year replacement funding requirements, and that the complete elimination of the reserve fund would necessitate an immediate, significant increase in annual appropriations for fleet replacement. Consequently, the Town should continue to make contributions to the replacement fund that ensure the maintenance of a small balance.

The chart below illustrates actual and projected fleet replacement debt service costs (net of fleet salvage proceeds) and funding requirements for FY 1999 – 2011. The amounts shown *include* the effects of inflation. Our projections of future P&I payments presume that patrol cars will be financed over a three year period and all other vehicles and pieces of equipment in the fleet over a seven-year period. Again, the contribution ("Net Funding") amounts shown were developed by the Town's Finance Department, using the contribution amounts projected in our original study as a point of departure.

It should be noted that at these funding levels the replacement reserve fund balance will eventually be depleted and the Town will need to decide in the next few years either to increase the contributions to the fund in order to maintain a fund balance or to let the fund balance run out and base future fleet replacement funding requirements on net debt service costs.

Net Fleet Replacement Spending and Funding Requirements FY 1999 - 2011

OTHER OPPORTUNITIES FOR IMPROVEMENT

During our assessment, we noted several ways in which the Town can improve the effectiveness of its fleet replacement planning and financing program, including the following.

- ?? Instead of financing all vehicle purchases for a period of three or five years as is the current practice, we recommend that the Town explore the feasibility of matching financing periods more closely to the replacement cycles of major categories of vehicles and equipment in the fleet, or to the average replacement cycle for all of the assets in the fleet – currently 7.9 years. At the minimum, we recommend that Police patrol units be financed over a three-year period and all other units be financed over a seven-year period. This would reduce debt service costs on a per-vehicle basis from those that the Town has experienced in the last three years. It also would further smooth out year-to-year replacement funding requirements and reduce the increase in funding requirements over the next several years.
- ?? We recommend that the Town update its fleet replacement plan on an annual basis. As the experience of the past three years illustrates, the replacement plan is a tool that should continue to evolve to meet the changing needs and demands

of the Town. By updating the plan annually, the Town can more accurately project future fleet replacement spending, financing, and funding requirements.

- ?? As the Town continues to renew the fleet, consideration should be given to reviewing the replacement parameters used to project vehicle and equipment replacements. With the advent of new technology and improved maintenance processes, the average replacement cycles for the various classes of vehicles should be reviewed and possibly extended to reflect the newer fleet.
- ?? We recommend that the Town explore the possibility of establishing multi-year debt financing programs of, say, three to five years' duration. The larger the size of the program, the more favorable the interest rate might be and the lower the cost of setting up and administering a lease-purchase program will be.
- ?? By deviating from the empirically calculated contribution rates established in the original study, the risk exists that future fleet replacement funding levels (i.e., contribution to the reserve fund) will be determined more by fiscal capacity and less by actual fleet replacement needs. Consequently, we recommend that the Town consider determining future contribution amounts using the hybrid replacement rate structure described in our original report.
- ?? The Town should consider distributing the costs of the contributions of the replacement fund to fleet users based on the specific fleet assets they own. In our experience, the improved recognition of vehicle cost that would result from such a charge-back process increases fleet utilization and creates opportunity to increase fleet utilization and to reduce fleet size.
